

Salesforce: what their public marketing signals are actually saying

A short, evidence-based read of what's publicly visible — not internal data I don't have access to.

How this was built: every point below is checkable by anyone, comparing salesforce.com's own regional page variants directly against each other. Nothing here claims insight into revenue, pipeline, or internal reporting.

1. A consent widget stuck in the page itself

- On at least one live salesforce.com page, a "Please Complete Captcha... Powered by TrustArc" block renders directly in the visible page content, rather than as a proper hidden overlay.
- For a company built on trust and data platforms, a visibly broken consent widget is a specific, avoidable credibility gap on the exact kind of element meant to build confidence.

2. The global footer isn't actually global

- The EU-generic version of the site footer lists a single social link: LinkedIn. The UK-specific version lists five: Facebook, Twitter, Instagram, YouTube and LinkedIn.
- Same brand, same footer position, genuinely different content depending on which regional template a visitor happens to land on.
- Neither version is wrong on its own, but a visitor moving between regional versions of the same brand would reasonably expect the same footer either way.

3. Specific pages still open with the basics

- A visitor who clicks into a specific, deep page — a named product form, a particular use case — is still greeted first with "New to Salesforce? What is CRM? What is Cloud Computing?"
- That's the right content for a first-time visitor on the homepage. On a page someone reached by clicking something specific, it's a missed chance to speak to what they already showed interest in.

4. The same template, repeated at enormous scale

- Multiple, entirely different URLs — different products, different regions, different campaigns — return close to the identical header and footer structure.
- That's normal and efficient at this size. It also means findings one and two aren't isolated to a single page; whatever's inconsistent in the template is likely live across a very large share of the site at once.

What this pattern usually means: a site this large is really hundreds of teams publishing into a small number of shared templates. Small drift — a stuck widget here, a missing social link there — is the normal cost of that scale, not a sign of neglect. The trade-off is that when something in the shared template is inconsistent, it isn't inconsistent on one page. It's inconsistent everywhere that template is used, all at once.

What I'd check first, in order

- 1 Fix the exposed consent widget as a priority, not a backlog item.** It's a visible, trust-relevant bug on a company selling trust and data platforms — the optics matter more here than on most sites.

- 2 Reconcile the regional footer templates.** Either every region gets the same social links, or there's a deliberate reason it doesn't — right now it reads as drift, not decision.

- 3 Let deep pages skip the "what is CRM" primer.** A visitor who clicked something specific has already answered that question — the template should be able to tell the difference.

Faisal Mahmud

FRACTIONAL MARKETING DIRECTOR

I review measurement, brand consistency and template-level structure for a living. If this kind of gap looks familiar in your own business, it's worth a proper look.
