

Revenue Measurement and Attribution Audit

Seven controls for finding where measurement breaks before a reporting decision reaches the boardroom.

Attribution is not a single number. Start by checking the controls that connect spend to a defined commercial outcome, then use experiments where you need to understand causal impact.

1**Commercial outcome and definitions**

Agree the primary outcome, value basis and decision metric before comparing channels.

2**Campaign taxonomy and governance**

Use one UTM and naming structure, controlled across markets, agencies and platforms.

3**Collection, consent and event quality**

Confirm consent behaviour, event firing, parameters and data loss before reading a trend.

4**Identity, deduplication and hand-off**

Prevent duplicate browser and server events; connect leads to qualified CRM outcomes.

5**Platform configuration and signals**

Separate primary from secondary conversions; send the platform the quality signal you value.

6**Independent reporting and reconciliation**

Compare platform claims with analytics, backend, CRM and finance using documented rules.

7**Decision validation and governance**

Use holdouts, geo tests or other suitable experiments when attribution cannot answer causality.

RED FLAGS TO VALIDATE

- Platform value cannot be reconciled with confirmed revenue.
- The same campaign appears under several names or rows.
- A performance swing has not been checked against event health.
- Two people can pull the same report and reach different answers.

WHAT GOOD LOOKS LIKE

- One definition register, taxonomy and named owner.
- Conversion events are tested, deduplicated and quality-linked.
- Differences are explained by model, window, identity or timing.
- Reporting shows attributed, confirmed and causal evidence clearly.
