

PRACTICAL TOOLKIT

Free Browser Extensions and Marketing Tools

A short list for checking tracking, redirects, page structure, speed, accessibility and customer behaviour without adding another subscription.

What this list is for

These tools help you inspect what is happening. They do not decide whether the measurement is commercially useful. Start with the business outcome, then use the smallest tool that answers the question.

Question	Start with
Are the tags present and firing?	Tag Assistant, Meta Ads Data Advisor, LinkedIn Pixel Helper
Is the page technically sound?	Detailed SEO, Redirect Path, Wappalyzer
Can people use the page?	WAVE, axe DevTools
Is the page fast and discoverable?	PageSpeed Insights, Search Console, Screaming Frog
Can campaign traffic be traced?	Campaign URL Builder and the UTM template
What do visitors actually do?	Microsoft Clarity

Before installing an extension, check its publisher, permissions and privacy policy. Remove anything you no longer use. Tool names, features and free limits can change. This guide was checked on 10 September 2026.

Tracking extensions

Google Tag Assistant

Access: Free Chrome extension.

Use it for: Finding Google tags on a page and troubleshooting Google Analytics, Google Ads and Google Tag Manager implementations.

Watch for: A visible tag does not prove that the event definition, consent state or business outcome is correct.

<https://support.google.com/tagmanager/answer/16463290?hl=en>

Meta Ads Data Advisor

Access: Free Chrome extension from Meta. It was previously called Meta Pixel Helper. A Meta login is required for some features.

Use it for: Checking a Meta Pixel implementation and guided setup for supported data connections.

Watch for: Use Meta Events Manager Test Events to confirm the final event and parameter flow. Do not rely on the extension alone.

<https://chromewebstore.google.com/detail/meta-pixel-helper/fdgfkebogiimcoedlicjlajpkdmockpc?hl=en>

LinkedIn Pixel Helper by Pearmill

Access: Free third-party Chrome extension.

Use it for: Seeing requests made to LinkedIn when the Insight Tag loads or a conversion pixel fires.

Watch for: It is not a LinkedIn product. Confirm the final domain and conversion status in LinkedIn Campaign Manager.

<https://pearmill.com/linkedin-pixel-helper>

Page structure and technical checks

Detailed SEO Extension

Access: Free Chrome and Firefox extension.

Use it for: Fast checks of page titles, descriptions, canonicals, robots directives, headings, links and structured data.

Watch for: It is a page-level inspection. Use a crawler when you need to check a whole site.

<https://detailed.com/extension/>

Redirect Path by Ayima

Access: Free Chrome extension.

Use it for: Seeing 301, 302, 404 and 500 responses, redirect chains and response headers while browsing.

Watch for: Check the final destination and whether the complete query string, including UTMs, survives every redirect.

<https://www.ayima.com/chrome/>

Wappalyzer

Access: Basic technology detection is free and does not require an account.

Use it for: Identifying a site's CMS, analytics, advertising, ecommerce and other visible technologies.

Watch for: Detection is based on public signals and can be incomplete. Review the extension's data-sharing settings before use.

<https://www.wappalyzer.com/apps/>

Screaming Frog SEO Spider

Access: Free desktop version for up to 500 URLs per crawl. Advanced features require a licence.

Use it for: Finding broken links, redirects, missing titles, duplicate metadata and crawl issues across a small or medium site.

Watch for: The free version cannot save or reopen crawls and restricts configuration and advanced integrations.

<https://www.screamingfrog.co.uk/seo-spider/>

Accessibility checks

WAVE

Access: Free Chrome, Firefox and Edge extensions.

Use it for: Evaluating a page for accessibility issues in the browser, including headings, labels, contrast and structural errors.

Watch for: Automated results need human judgement. Check keyboard navigation, focus order and content meaning as well.

<https://wave.webaim.org/extension/>

axe DevTools

Access: Free browser extension for basic automated page-by-page checks. Paid versions add guided and team features.

Use it for: Finding common accessibility defects and reading remediation guidance in Chrome, Edge or Firefox.

Watch for: Automation only detects part of the problem. A clean scan does not mean the page is fully accessible.

<https://www.deque.com/axe/devtools/extension/>

A sensible order

- ☐ Use WAVE for a clear visual overview.
- ☐ Use axe DevTools to inspect the underlying rule failures.
- ☐ Navigate the page with a keyboard and zoom text to 200 per cent.
- ☐ Check forms, errors, focus and confirmation messages manually.

Free web tools

PageSpeed Insights

Access: Free web tool.

Use it for: Checking mobile and desktop page performance with Lighthouse lab data and available real-user data.

Watch for: One test is a snapshot. Test the live URL more than once and focus on the underlying metrics, not only the score.

<https://pagespeed.web.dev/>

Google Search Console

Access: Free with a Google account and verified site property.

Use it for: Monitoring search performance, indexing, page experience and Google-detected site issues.

Watch for: It only covers Google Search. Compare it with GA4 to understand what visitors do after the click.

<https://search.google.com/search-console/about>

Campaign URL Builder

Access: Free web tool.

Use it for: Adding campaign parameters to a URL for measurement in Google Analytics.

Watch for: The tool builds a URL. It does not enforce a shared taxonomy. Use the UTM template before generating links at scale.

<https://ga-dev-tools.google/campaign-url-builder/>

Microsoft Clarity

Access: Free web analytics tool with session recordings and heatmaps.

Use it for: Seeing where users click, how far they scroll and where journeys appear to stall.

Watch for: Review consent, masking and data governance before adding the script. Behaviour data does not replace conversion and revenue measurement.

A 20-minute page check

Use the same order each time so the evidence is comparable.

Minutes	Check	Tool	Question
0-3	Outcome	Your measurement plan	What customer action and commercial result should this page produce?
3-7	Tracking	Tag Assistant and the relevant platform helper	Do the right tags and events fire once, with the right consent state?
7-10	Redirects	Redirect Path	Does the final URL load correctly and retain every UTM parameter?
10-13	Page structure	Detailed SEO	Are the title, description, canonical, robots and headings correct?
13-16	Speed	PageSpeed Insights	What is slowing the mobile experience and is the problem repeatable?
16-18	Accessibility	WAVE or axe DevTools	Can people understand and operate the page, including its forms?
18-20	Behaviour	Clarity if installed	Where do users hesitate, abandon or click something unexpected?

Keep one evidence log

Record the URL, date, tool, finding, owner and fix. Recheck the same URL after any material release. This creates a useful history and stops the same issue being rediscovered from scratch.

Use the tools to answer four questions

- ☐ Did the customer action happen?
- ☐ Was it measured once and sent to the right systems?
- ☐ Can the record be connected to campaign and commercial data?
- ☐ Would another person reach the same conclusion from the evidence?

Need help checking the full journey

I review the commercial objective, campaign setup, site journey, tracking and reporting together. Book a 15 min discovery call at faisalconsulting.co.uk.
