

MARKETING MEASUREMENT

Marketing Tracking QA Checklist

Use this before launch and again after real traffic starts. Keep evidence for every pass. If a check cannot be evidenced, it is not complete.

How to use it

Work from the commercial outcome back to the tag. Test once with consent granted and once with consent withheld. Use test data that can be identified and removed from reporting.

1. Outcome and measurement plan

- ☐ The primary commercial outcome is named. Examples include qualified pipeline, revenue, bookings, donations or retained customers.
- ☐ The marketing conversion is defined separately from the commercial outcome.
- ☐ The exact event trigger is written down. A page view, button click and confirmed submission are not treated as the same action.
- ☐ The source of truth is agreed for each metric. Platform, GA4, CRM and finance totals are not blended without explanation.
- ☐ The baseline, target, timeframe, owner and reporting cadence are recorded.
- ☐ Known measurement gaps and expected platform differences are documented before launch.

2. Consent and base tags

- ☐ The consent banner reflects the cookies and marketing tags actually used on the site.
- ☐ Analytics and advertising tags wait for the appropriate consent where required.
- ☐ GA4 loads once on every intended page and uses the correct measurement ID.
- ☐ Google Tag Manager loads once if it is used. Old hard-coded copies have been removed.
- ☐ LinkedIn Insight Tag loads once with the correct partner ID.
- ☐ Meta Pixel loads once with the correct pixel ID when implemented.
- ☐ Internal, agency and test traffic can be identified or excluded without hiding genuine customers.

Event and campaign checks

3. Event implementation

- ☐ Each event fires on the intended action, not on page load or an earlier click.
- ☐ The event fires once per action. Refreshes, retries and single-page application navigation do not create duplicates.
- ☐ Event names match the agreed specification and use consistent case and spelling.
- ☐ Required parameters are present, including value, currency, item, form or campaign identifiers where relevant.
- ☐ Revenue values use the correct units and do not include tax, fees or refunds unless the definition says they should.
- ☐ Test events are visible in the platform test tool and GA4 DebugView or Realtime.
- ☐ Failed submissions, validation errors and cancelled bookings do not count as conversions.
- ☐ Cross-domain journeys preserve the user and session where the journey requires it.

4. Campaign naming and UTMs

- ☐ Source, medium and campaign are present on every campaign URL that needs manual tagging.
- ☐ Values follow one lower-case naming convention. Spaces, mixed case and near-duplicate names have been removed.
- ☐ Paid search auto-tagging and manual UTMs are not creating conflicting campaign data.
- ☐ Creative, audience and placement can be distinguished through utm_content or another agreed field.
- ☐ Redirects preserve the full query string and do not strip UTMs.
- ☐ The same taxonomy is used by the media platform, analytics and CRM where those fields are available.

Commercial hand-off

5. Forms, CRM and revenue

- ☐ Every form, calendar, phone or checkout route has a confirmed success state that can be measured.
- ☐ The thank-you page cannot be reached accidentally or repeatedly without a genuine completion where practical.
- ☐ Lead source, campaign and click identifiers pass into the CRM or order record where the stack supports it.
- ☐ The joining identifier between website activity and CRM, booking or revenue data is documented.
- ☐ Qualified, unqualified, duplicate, test and spam records have clear definitions.
- ☐ Offline conversions or revenue are sent back to media platforms only after quality, consent and deduplication checks.
- ☐ A sample journey has been traced from ad click to the final commercial record.

6. Post-launch monitoring

- ☐ A live test is completed after deployment using the production domain.
- ☐ Event volume is compared with the previous baseline and the expected level of traffic.
- ☐ GA4 conversions are reconciled with form, calendar, CRM or transaction records.
- ☐ Platform conversions are compared with independent data. Differences are explained, not forced to match.
- ☐ Sudden drops, duplicate events and missing parameters have named alert thresholds and owners.
- ☐ Site, consent, form and campaign changes are recorded with dates so performance shifts can be investigated.
- ☐ Tracking is reviewed after every material release and at an agreed regular interval.

Evidence and sign-off

Record where the proof sits. Screenshots alone are useful evidence, but they do not replace a live end-to-end test.

Area	Evidence or link	Owner	Date
Consent			
Base tags			
Events			
UTMs			
CRM hand-off			
Post-launch			

Stop and investigate if

- ☐ The platform reports more conversions than there are confirmed outcomes and nobody can explain the difference.
- ☐ An event volume changes sharply on the same date as a site, consent or form release.
- ☐ Campaign data is split across different names, cases or source and medium combinations.
- ☐ A dashboard shows a result that cannot be traced to a raw event or commercial record.
- ☐ The team calls a tracking problem a performance problem before checking the tag.

Need a second view
